Preparation of the Materials

1) Remove the clear dome from the upper tank. Do not remove the two vacuum hoses.
2) Lift the upper recovery tank from the machine and set aside.
3) Fill the solution tank with hot water.
4) Reinstall recovery tank and dome. Make sure the hoses are snug in the dome.

Procedure

1) Vacuum the carpet and make sure it is cleared of surface debris.
2) Pre-spray carpet with chemical.
3) Adjust brush to proper cleaning position by using the lever located at the lower back of the motor housing.
4) Check to be sure that the solution directional valve is set on “Carpet Spray”.
5) Dispense water by using either the “Continuous Flow” or the “Intermittent Solution” button. Walking backwards, move the machine over the area to be cleaned. The machine’s brush assistance should allow the unit to be moved.
6) As you work, check to see if there is foam buildup in the recovery tank. If there is, turn the machine off and add the recommended amount of defoamer to the recovery tank. Never put defoamer in the solution tank!
7) When the machine runs out of water, turn off the machine, remove the dome and recovery tank, and refill the clean solution tank. Replace the recovery tank and dome. Turn the machine back on and continue cleaning.
8) Ventilate the area after the carpet has been cleaned.

Cleanup

1) Drain the solution tank.
2) Drain recovery tank and clean thoroughly.
3) Run vacuum motor with tank off for 1-2 minutes.
4) Check and clean intake filter and dome seal.
5) Check and clean tank seals.
6) Check and clean brush.
7) Clean debris off brush housing.
8) Check and clean vacuum shoe.
9) Check and clean spray jets.
10) Check and clean electrical cord.
11) Clean exterior of machine.
